PERMANENT MAKEUP LASER REMOVAL PRE-PROCEDURE ADVICE

Before we begin your course of laser removal treatments, we will carry out an in-depth consultation and perform a patch test on the area being treated. Before you come in for your consultation and patch test, it is important that you know and understand the following so that you can decide whether you will be able to have the treatment done.

You will not be able to have Permanent Makeup Laser Removal if:

- The area being treated has been exposed to the sun/tanned within the last four weeks
- You have fake tan on the area being treated
- You suffer from seizure disorders triggered by light
- You are pregnant or breastfeeding
- You are taking medication which is known to increase sensitivity to light
- You have a rash, pimple or infection in the area that is to be treated
- You have type 1 diabetes
- You have type 2 diabetes, unless you can provide a doctors note

To prepare for your treatment you must:

- Have skin that is free of active tan for at least four weeks (this is very important as you will be at increased risk of hyper/hypo pigmentation). Sun exposure is the most common reason for treatment refusal
- Not apply fake tan to the area for two weeks before treatment
- Avoid painkillers on the day of treatment that are anti-inflammatory as these can thin the blood
- Stop using retinols, AHA and BHA acids and any other harsh chemicals on skin for a week before treatment
- Not tint or wax the eyebrows for at least two weeks prior to treatment
- Try to keep the body and skin as hydrated as possible in the lead up to treatment. Hydration after treatment will also speed up fading so increase your water intake
- Tell us if you have a history of skin healing problems or keloid scarring
- Apply Crème Rescue Serum to the full face and neck to help prepare the skin for treatment
